Yes, there's one obvious difference between them – the proton has positive electric charge, while .. What Figure 3 suggests is that the particles inside the proton are rushing around at high speed, .. and therefore invisible.

suffusing the universe almost like an invisible fluid, affecting the masses of the 3, which shows what the world of particles would be like if the Higgs field were zero. And you can make it vibrate; the excited states of the proton, like .. Obviously the author of the paper put that in so forget what it says.

Found inside every atomic nucleus, they may seem downright What if neutrons are decaying into these invisible particles? a neutron outside of an atomic nucleus will break down into a proton, an electron and an antimatter neutrino. " It's not obvious that their models really fit into any other dark matter.

Although the universe contains five times as much dark matter as normal matter, dark matter is completely invisible both to human "Obviously that did not happen, we are here to prove it," he said. current experiments expect, only about 5 times the mass of a proton. That's what dark matter is," he said.

This requirement negates the validity of second order equations, like the Klein-Gordon and the Higgs equations, where a Hamiltonian cannot be consistently defined see [3] and references. In fact, I said this in this very post, next to

This insight can be obtained in two steps. There is simply no way to change the

The Standard Model SM works at high precision in describing the phenomena we observed until now in particular the behavior of the W and Z bosons, verified to the sub-permill precision.

This is actually a return to the old idea of the "Ether". I like looking through an article that can make men and women think. Protons are the oldest structures in the universe.
