When talking about diabetes, it is impossible not to mention the use of blood glucose meters. One possible application for this technique is to make personalised red blood cells for blood transfusions, but this is still far from becoming a clinical reality", says Johan Flygare, manager of the research group and in charge of the study. The skin cell on which the study was based had access to the instruction manual. Researchers at Lund University in Sweden, together with colleagues at Center of Regenerative Medicine in Barcelona, have successfully identified the four genetic keys that unlock the genetic code of skin cells and reprogram them to start producing red blood cells instead. With the help of a retrovirus, they introduced different combinations of over 60 genes into the skin cells' genome, until one day they had successfully converted the skin cells into red blood cells. The thing that distinguishes the cells is which chapter of the manual the cell all four are necessary in order for it to work.
